# ORACLE Academy

# **Objectives**

- This lesson covers the following objectives:
  - -List the benefits of using parameters with cursors
  - Create PL/SQL code to declare and use a cursor with a parameter

PLSQL 5-4 Cursors with Parameters

#### Purpose

- Consider a program which declares a cursor to fetch and process all the employees in a given department, and the department is chosen by the user at runtime
- How would we declare the cursor?
- We don't know the department id when we write the code, but this won't work

```
DECLARE
```

```
CURSOR cur_emps IS

SELECT * FROM employees

WHERE department_id = ???;
```

Academy

PLSQL 5-4 Cursors with Parameters

#### **Purpose**

- There are several departments
- Do we need to declare several cursors, one for each department, each with a different value in the WHERE clause?
- No we can declare just one cursor to handle all departments by using parameters

PLSQL 5-4 Cursors with Parameters

#### A Million Silver

#### **Cursors with Parameters**

- A parameter is a variable whose name is used in a cursor declaration
- When the cursor is opened, the parameter value is passed to the Oracle server, which uses it to decide which rows to retrieve into the active set of the cursor

PLSQL 5-4 Cursors with Parameters

#### A SIMILITY SINKS

#### **Cursors with Parameters**

- This means that you can open and close an explicit cursor several times in a block, or in different executions of the same block, returning a different active set on each occasion
- Consider an example where you pass a location\_id to a cursor and it returns the names of the departments at that location
- The next slide shows how

PLSQL 5-4 Cursors with Parameters

# Cursors with Parameters: Example

```
DECLARE
  CURSOR cur country (p region id NUMBER) IS
     SELECT country id, country name
       FROM countries
       WHERE region id = p region id;
  v country record
                        cur country%ROWTYPE;
BEGIN
                                                   Change to whichever
  OPEN cur country (5);
                                                    region is required.
  LOOP
    FETCH cur country INTO v country record;
    EXIT WHEN cur country%NOTFOUND;
    DBMS OUTPUT.PUT LINE(v country record.country id | | ' '
                              || v country record.country name);
  END LOOP;
  CLOSE cur country;
END;
ORACLE
Academy
                     PLSQL 5-4
                                            Copyright © 2020, Oracle and/or its affiliates. All rights reserved.
                     Cursors with Parameters
```

In a production environment, the location\_id would not be hard-coded in the OPEN statement, but would be "entered" by the user in the interface to the database.

### **Defining Cursors with Parameters Syntax**

- Each parameter named in the cursor declaration must have a corresponding value in the OPEN statement
- Parameter data types are the same as those for scalar variables, but you do not give them sizes
- The parameter names are used in the WHERE clause of the cursor SELECT statement

```
CURSOR cursor_name

[(parameter_name datatype, ...)]

IS

select_statement;

9
```

We specify the datatype of the cursor parameter, but not the size. For example: VARCHAR2, not VARCHAR2(20).

When the cursor is opened, the parameter value is passed to the Oracle server, which uses it to decide which rows to retrieve into the active set of the cursor. This means that you can open and close an explicit cursor several times in a block, or in different executions of the same block, returning a different active set on each occasion.

# **Defining Cursors with Parameters Syntax**

- In the syntax:
  - -cursor name Is a PL/SQL identifier for the declared cursor
  - -parameter\_name Is the name of a parameter
  - -datatype Is the scalar data type of the parameter
  - -select\_statement Is a SELECT statement without the INTO clause

```
CURSOR cursor_name
  [(parameter_name datatype, ...)]
IS
  select_statement;
```

10

# **Opening Cursors with Parameters**

• The following is the syntax for opening a cursor with parameters:

OPEN cursor\_name(parameter\_value1, parameter\_value2, ...);

PLSQL 5-4 Cursors with Parameters

#### **Cursors with Parameters**

- You pass parameter values to a cursor when the cursor is opened
- Therefore you can open a single explicit cursor several times and fetch a different active set each time
- In the following example, a cursor is opened several times

PLSQL 5-4 Cursors with Parameters

#### **Cursors with Parameters**

```
CURSOR cur_countries (p_region_id NUMBER) IS

SELECT country_id, country_name FROM countries

WHERE region_id = p_region_id;

v_country_record c_countries%ROWTYPE;

BEGIN

OPEN cur_countries (5);
...

CLOSE cur_countries;
OPEN cur_countries (145);
...
```

Academy

PLSQL 5-4 Cursors with Parameters

# Another Example of a Cursor with a Parameter

```
DECLARE
  v deptid
               employees.department id%TYPE;
  CURSOR cur emps (p deptid NUMBER) IS
    SELECT employee id, salary
       FROM employees
       WHERE department id = p deptid;
                    cur emps%ROWTYPE;
  v emp rec
BEGIN
  SELECT MAX(department id) INTO v deptid
    FROM employees;
  OPEN cur emps (v deptid);
  LOOP
    FETCH cur emps INTO v emp rec;
    EXIT WHEN cur emps%NOTFOUND;
    DBMS OUTPUT.PUT LINE(v emp rec.employee id ||
                             || v emp rec.salary);
  END LOOP;
  CLOSE cur emps;
ORACLE
Academy
                     PLSQL 5-4
                                            Copyright © 2020, Oracle and/or its affiliates. All rights reserved.
                     Cursors with Parameters
```

The purpose of this code is to fetch and display all employees in the department with the highest department id.

Note that the maximum department id is stored in the v deptid variable and is then passed into the empcur cursor.

Note also that the SELECT MAX(department id) .... will always return exactly one row, so an explicit cursor is not needed for this.

#### Marin Sillian

# Cursor FOR Loops with a Parameter

- We can use a cursor FOR loop if needed:
  - Parameters are placed inside parentheses following the CURSOR
  - FOR...END LOOP statements let you execute a sequence of statements multiple times
  - The CURSOR will repeatedly use new value(s) that are passed into the parameter

```
DECLARE
   CURSOR   cur_emps (p_deptno NUMBER) IS
   SELECT   employee_id, last_name
       FROM       employees
       WHERE   department_id = p_deptno;

BEGIN
   FOR v_emp_record IN cur_emps(10) LOOP
    ...
   END LOOP;
END;
```

### Cursors with Multiple Parameters: Example 1

 In the following example, a cursor is declared and is called with two parameters:

```
DECLARE
  CURSOR cur countries (p region id NUMBER, p population
NUMBER) IS
    SELECT
              country id, country name, population
       FROM
                countries
                region id = p region id
       WHERE
       OR
               population > p population;
BEGIN
  FOR v country record IN cur countries (145,10000000) LOOP
    DBMS OUTPUT.PUT LINE (v country record.country id | | ' '
                              || v country record. country name||'
                              || v country record.population);
  END LOOP;
END;
